Total Body Modification therapy is an alternative therapy technique used by chiropractics that is based in applied kinesiology and knowledge of the body's reflex points. In Total Body Modification, practitioners work to find which organ of the body is responsible for problems that a person may be experiencing.

After discovering the source of the problem, chiropractics who perform this procedure work to correct the problem via working with the patient's nervous system.

So how exactly does Total Body Modification work? The chiropractor performing the procedure uses reflex points located in the body along with their knowledge of applied kinesiology. Once the source of the problem is found, the chiropractic will stimulate certain areas of the spine to try to help correct the problem. Since the spine is one of the most important parts of the human body, helping to regulate the body's every function, it can often be the key to repairing any problems that the body may be having. Using Total Body Modification to help decrease the spine's role in any problem that you may be having may help you get through a health problem that you may have previously thought to be unfixable. Varying levels of success have been purported through this methodology, with some claiming that the process can help to aid the body's immune response, blood sugar levels, and energy levels. The use of Total Body Modification in treating allergies is also of some importance, with many reporting that the treatment helped them to conquer their allergy problems.

Dr. Gordon DuBois is experienced in TBM, Applied Kinesiology and believes in regular chiropractic adjustments. He's been working in the field of chiropractic care for over thirty years with an unmatched level of quality. Operating out of New Orleans Chiropractic clinic, anyone who considers their spinal health to be of the utmost importance should accept no substitutes.
